

Linde Gas SIA Energy Policy

As part of our HSE policy, care for the environment is a foundational principle for our business.

Energy management in Linde REN is a strategic tool that reflects our commitment to continuously improving the energy efficiency of our production, operations, sites, and activities, with the purpose of mitigating climate change by lowering energy-related environmental impacts.

We comply with legal requirements and other requirements which we have agreed to.

We will map our energy use, define indicators, set targets, and measure against these. Targets and performance will be reviewed annually.

Our energy management will ensure that sufficient resources, competence and information are available, to enable fulfilment of this policy. This is being done by focusing on the energy consumption of our daily operations and new projects.

In new projects with energy intensive products and services we will choose modern energy efficient technologies, as far as technically possible and economically acceptable.

Internal communication will give awareness to employees of what they can do to minimise the energy consumption and be encouraged to bring up suggestions for energy improvement activities.

Energy efficiency will be one factor when choosing suppliers and contractors.

The work with energy management will be evaluated periodically to ensure compliancy with this policy, and to evaluate the need to revise it.
